Using Physical Edges to Assist Target Acquisition on Mobile Device Touch Screens

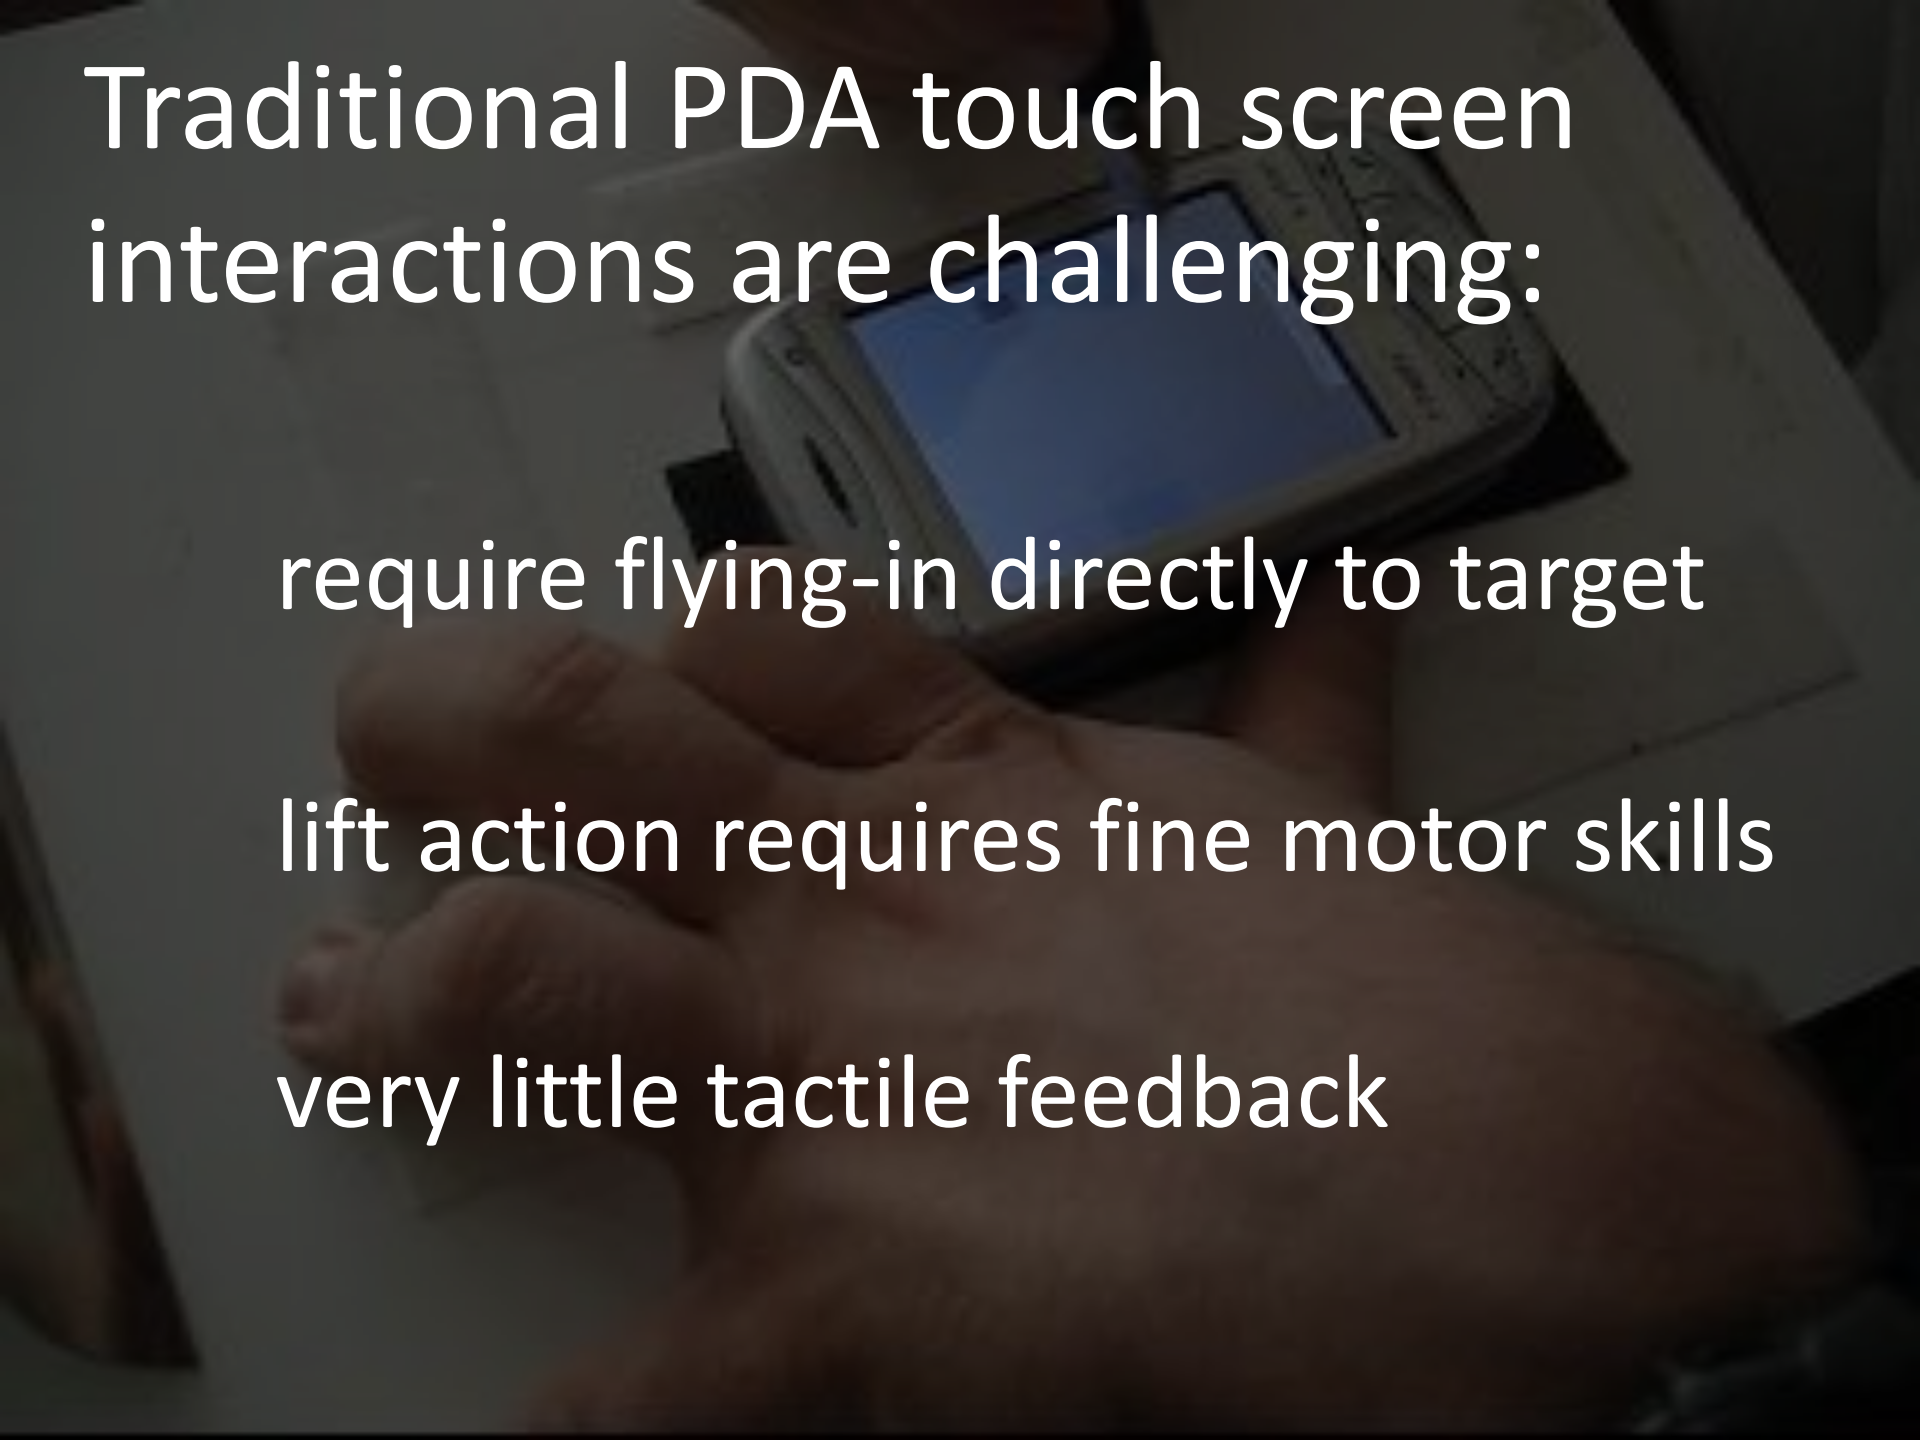

Jon Froehlich¹

Jacob O. Wobbrock^{1,2} and Shaun Kane²

¹Computer Science and Engineering

²The Information School

A hand is shown holding a PDA (Personal Digital Assistant) device. The device has a small screen and a keypad. The background is dark and out of focus.

Traditional PDA touch screen interactions are challenging:

require flying-in directly to target

lift action requires fine motor skills

very little tactile feedback

Utilize Screen, Edge & Corners

Allow user to rely on screen surface to assist movement.

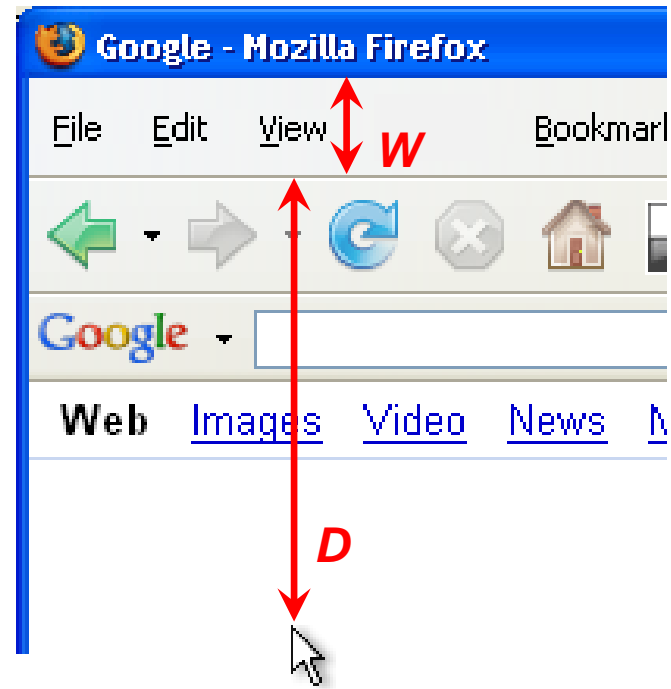

Use screen edge to guide movement.

Use screen corner to trap movement.

Virtual Edges

Physical Edges

Wobbrock, J., Myers, B. A., and Kembel, J. A. *UIST '03*

Barrier Targets

- Targets placed around screen perimeter
- Targets are stroked into rather than tapped

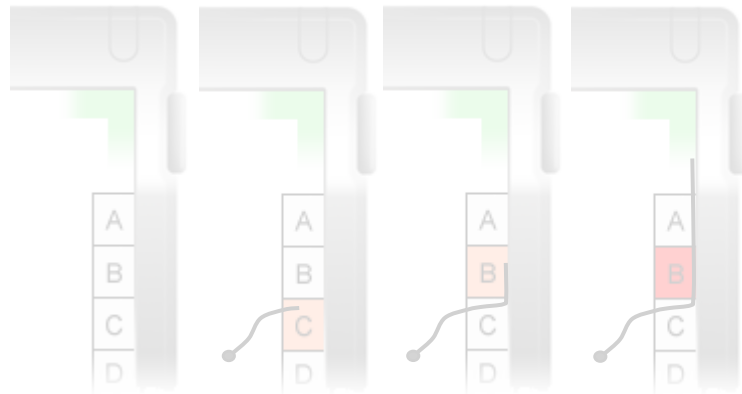

Existing Interface

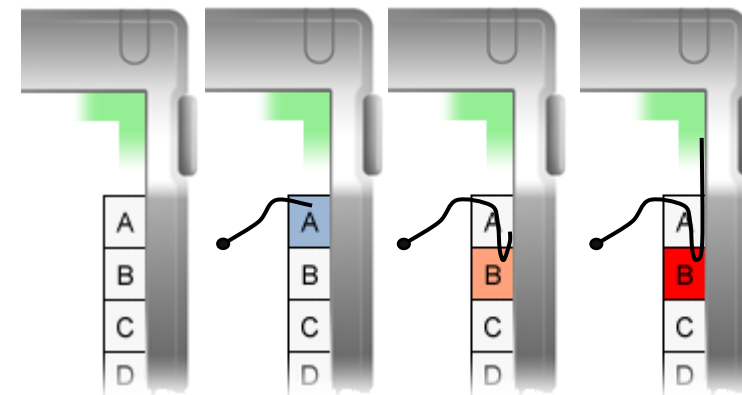

Realigned Barrier
Target Interface

**Edge Stroke with
Lift Confirmation**

**Velocity Stroke with
Corner Confirmation**

**Reverse Stroke with
Corner Confirmation**

Initial Study

18 Subjects (9 Able Bodied / 9 Motor Impaired)

- Recruited subjects from Seattle area using Craigslist, listservs and word-of-mouth
- Broad Range of Motor Impairments
 - Parkinson's disease, low strength, tetraplegia, cerebral palsy

Five Conditions

1. Fly-in
and Tap

2. Edge Fly-
in and Tap

3. Edge
Stroke
w/Lift
Confirm

4. Velocity
Stroke
w/Corner
Confirm

5. Reverse
Stroke
w/Corner
Confirm

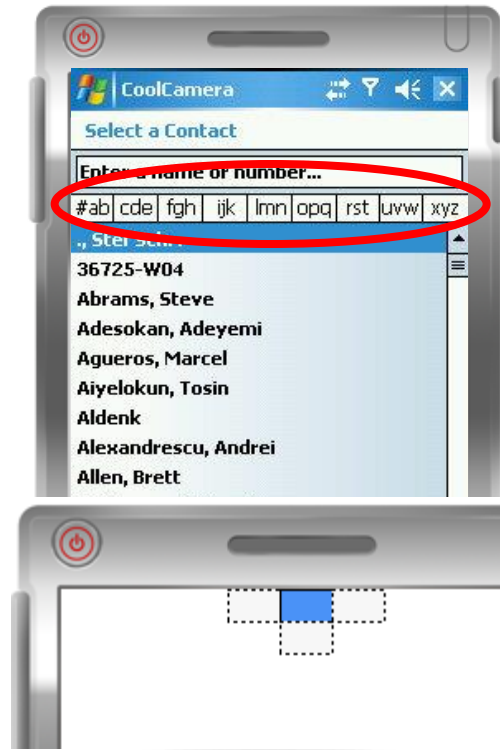

Baseline Conditions

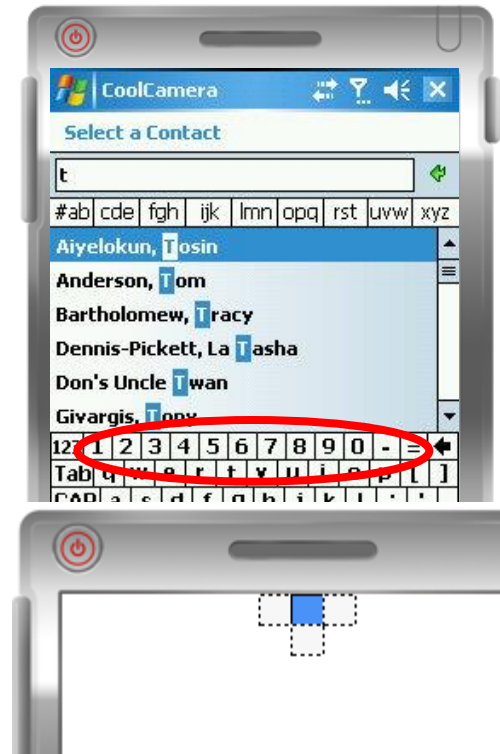

Target Sizes

Large: 59x28 pxls

Medium: 26x16 pxls

Small: 15x16 pxls

Results

Overall target acquisition times were not statistically different for barrier pointing vs. traditional “fly-in and tap”

However...

Two of the most severely impaired subjects benefited greatly from the Barrier Pointing techniques

Case Studies

Subject: MI4

Condition:

Tetraplegia (SCI C5). No use of triceps, pectorals, hands. Limited shoulder movement.

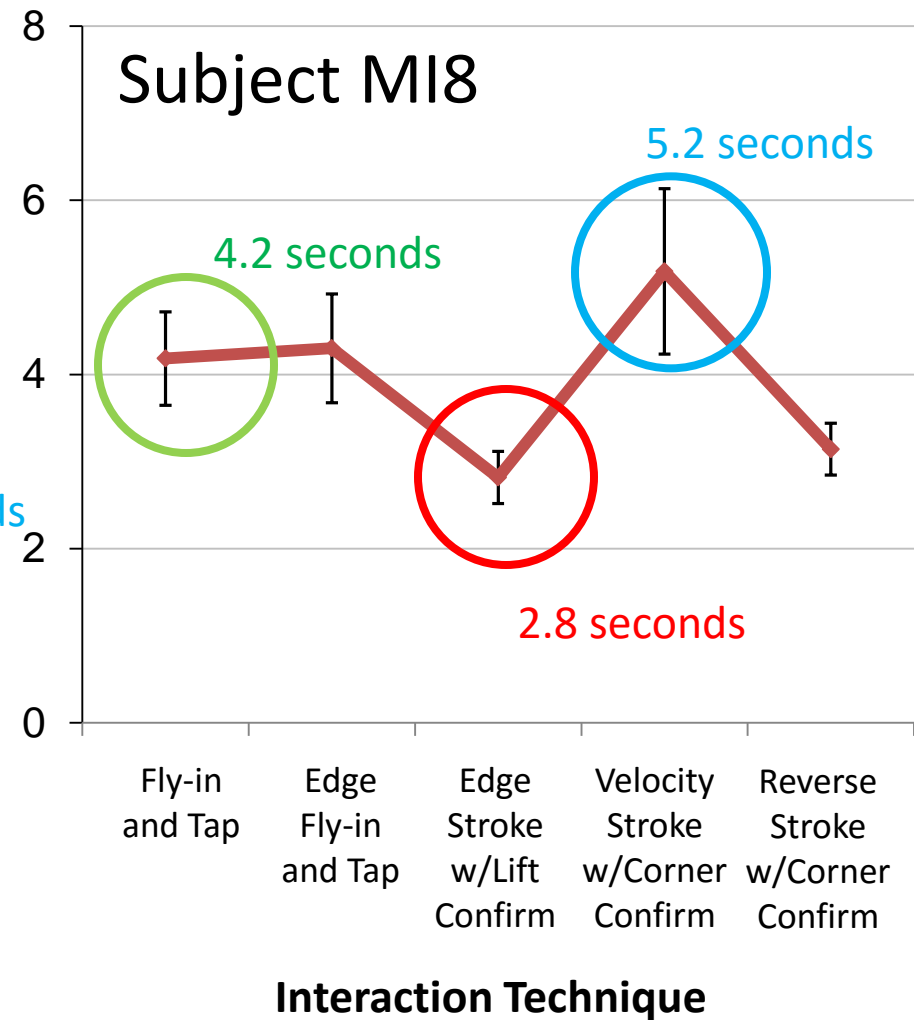

Subject: MI8

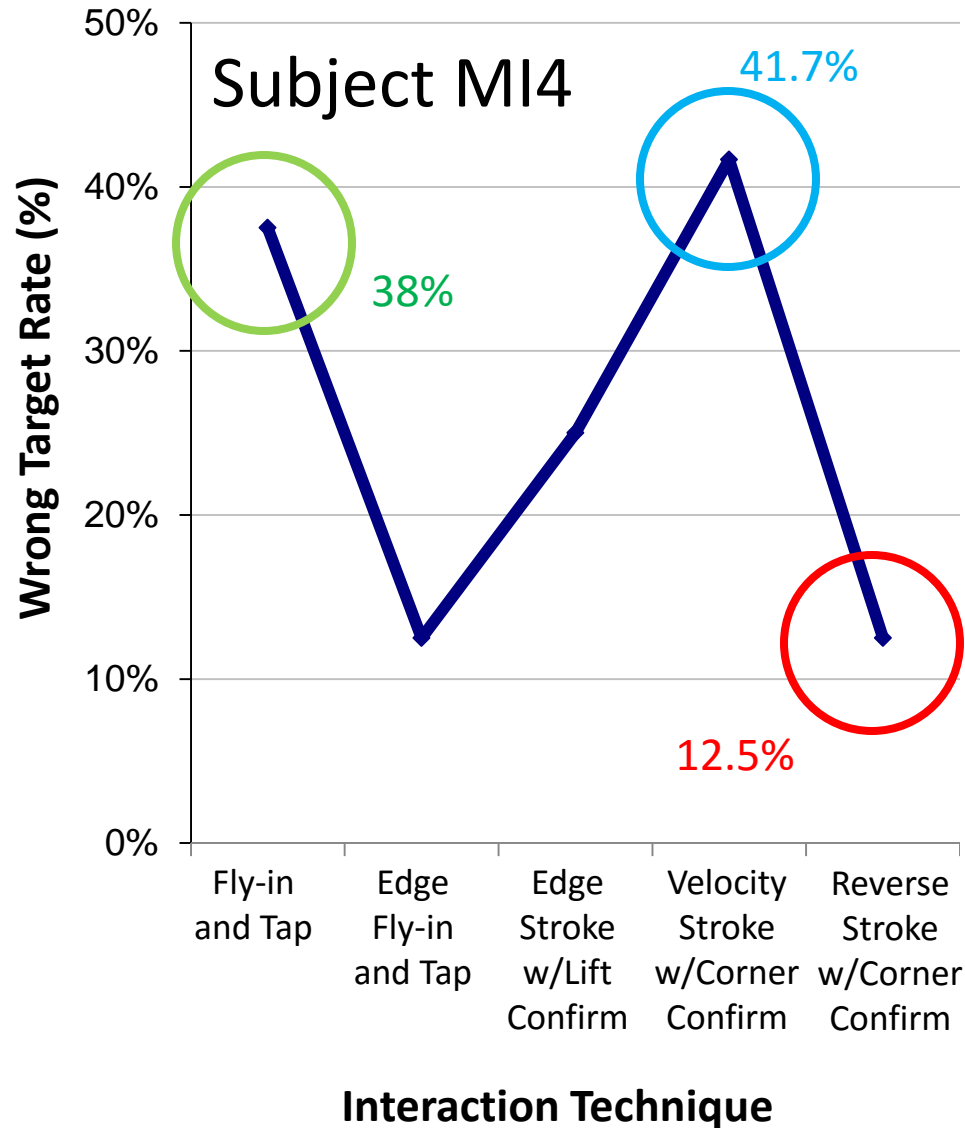

Condition:

Spastic Cerebral Palsy. Lack of fine motor skills. Spastic, uncontrollable movements.

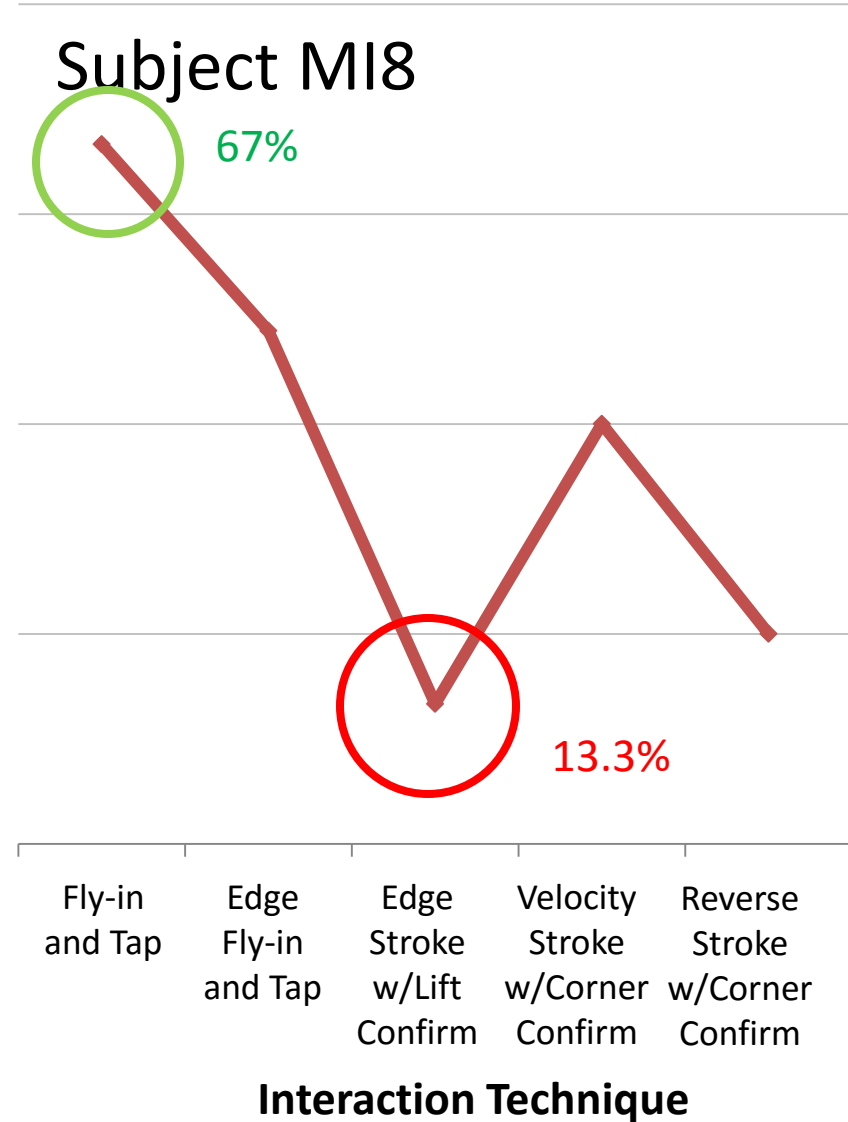

Average Target Acquisition Times

Error Rates

Miss Rates

Condition 1: Fly-in and Tap

Subject MI4

Watch for:

High rate of wrong target acquisitions

Difficulty with all target sizes

High miss rate

BACK TO COLLEGE

Condition 1: Fly-in and Tap

Subject M18

A person with short grey hair and glasses is shown from a high angle, looking down at a smartphone held in their right hand. The phone is resting on a clipboard with a silver clip at the top. The person is wearing a light-colored, short-sleeved shirt. The background is dark and out of focus.

Watch for:

Difficulty with fly-in motion

Large number of accidental taps

High rate of slippage

Condition 3: Edge Stroke w/Lift Confirmation

Subject M14

Watch for:

The edge results in smoother motion

The lift causes jerkiness

Returning to screen after lift is difficult

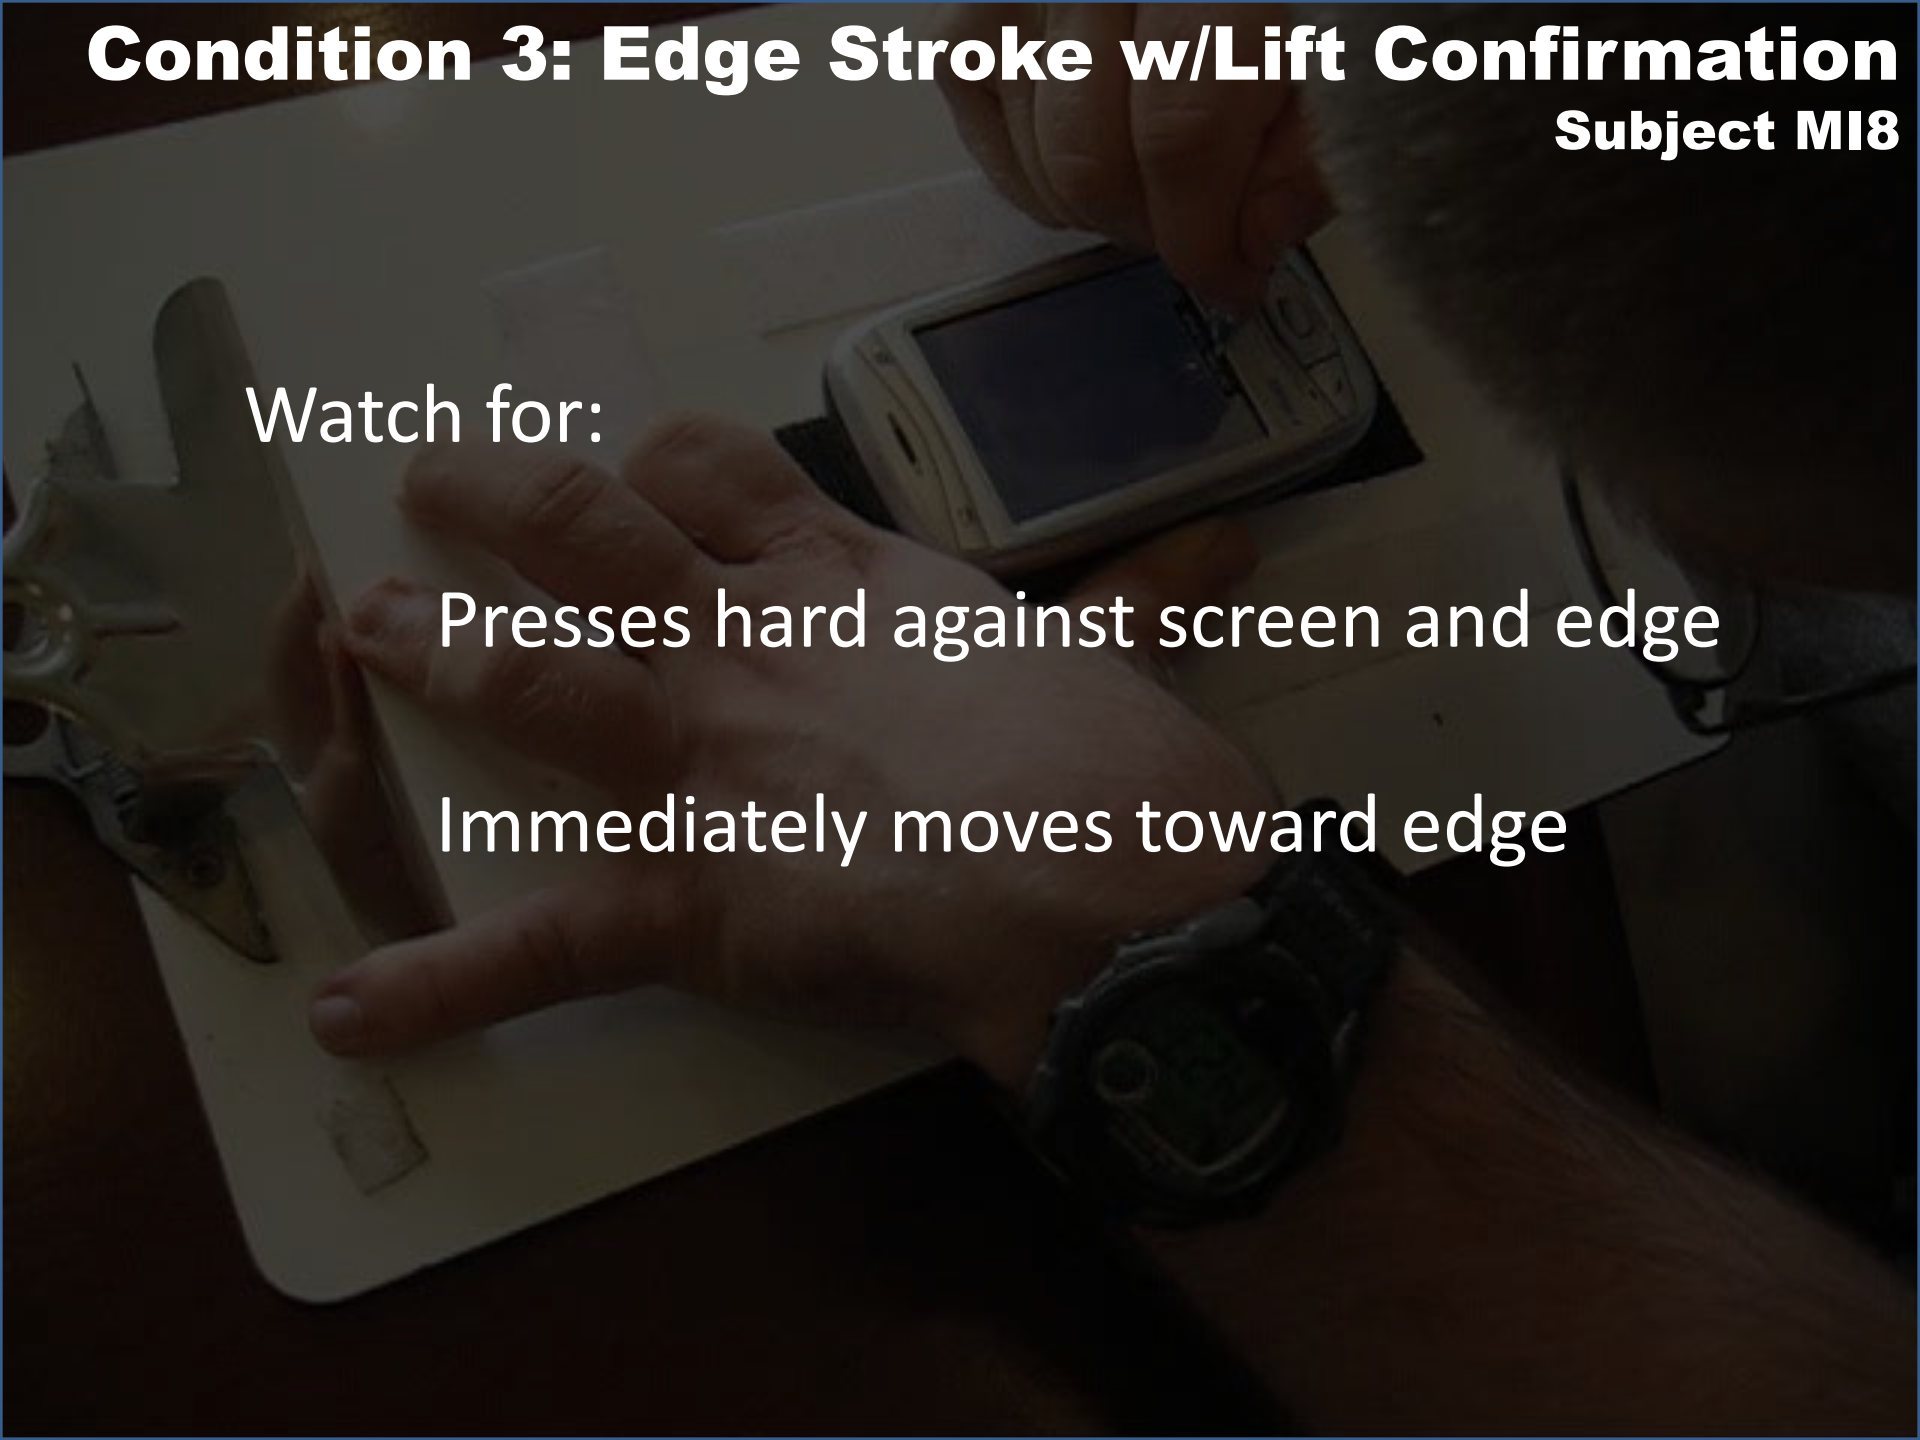

Condition 3: Edge Stroke w/Lift Confirmation

Subject M18

Watch for:

Presses hard against screen and edge

Immediately moves toward edge

**Condition 5: Reverse Stroke w/Corner
Confirmation
Subject M14**

Watch for:

A nice smooth controlled stroke

Requires most movement (fatigue?)

**Condition 5: Reverse Stroke w/Corner
Confirmation
Subject M18**

Watch for:

Edge allows a nice smooth controlled stroke

Ability to adjust to an incorrect selection

Table of Results

(lower is better)	Time	
	MI4	MI8
Condition 1 “Fly-in and Tap”	1.6 sec	4.2 sec
Condition 2 “Edge Fly-in and Tap”	1.1 sec	4.3 sec
Condition 3 “Edge Stroke w/Lift Confirm”	1.1 sec	2.8 sec
Condition 4 “Velocity Stroke w/Corner Confirm”	1.9 sec	5.1 sec
Condition 5 “Reverse Stroke w/Corner Confirm”	2.8 sec	3.1 sec

Table of Results

(lower is better)	Time		Error Rate	
	MI4	MI8	MI4	MI8
Condition 1 “Fly-in and Tap”	1.6 sec	4.2 sec	37.5%	22.2%
Condition 2 “Edge Fly-in and Tap”	1.1 sec	4.3 sec	12.5%	17.8%
Condition 3 “Edge Stroke w/Lift Confirm”	1.1 sec	2.8 sec	25%	17.8%
Condition 4 “Velocity Stroke w/Corner Confirm”	1.9 sec	5.1 sec	41.7%	42.2%
Condition 5 “Reverse Stroke w/Corner Confirm”	2.8 sec	3.1 sec	12.5%	6.7%

Table of Results

(lower is better)	Time		Error Rate		Miss Rate	
	MI4	MI8	MI4	MI8	MI4	MI8
Condition 1 “Fly-in and Tap”	1.6 sec	4.2 sec	37.5%	22.2%	29.2%	66.7%
Condition 2 “Edge Fly-in and Tap”	1.1 sec	4.3 sec	12.5%	17.8%	12.5%	49%
Condition 3 “Edge Stroke w/Lift Confirm”	1.1 sec	2.8 sec	25%	17.8%	4.2%	13.3%
Condition 4 “Velocity Stroke w/Corner Confirm”	1.9 sec	5.1 sec	41.7%	42.2%	29.2%	40%
Condition 5 “Reverse Stroke w/Corner Confirm”	2.8 sec	3.1 sec	12.5%	6.7%	41.7%	20%

Future Work

- Explore multiple target acquisitions per trial
- Apply barrier pointing to finger/thumb based interaction
- Begin creating barrier pointing widgets and interfaces

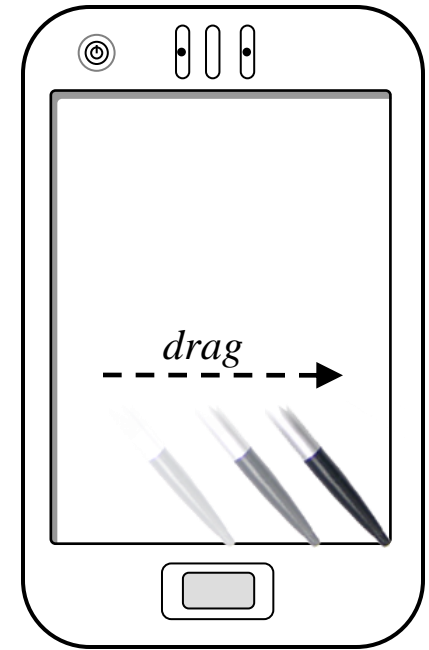

Conclusion

Screen

Edge

Corner

thankyou!

Acknowledgements

I'd like to acknowledge my co-authors Jacob O. Wobbrock and Shaun Kane for a wonderful collaboration, UW Rehabilitative Medicine, the study participants, and Susumu Harada and Anna Talman for their helpful edits/comments on the paper.

OLD / BACKUP SLIDES

Our Approach

Can we utilize the device's raised edge along the screen perimeter to assist the fly-in movement?

Edge Provides Tactile Feedback

Touchpad's often utilize edge to shortcut access to functions such as scroll, maximize, etc.

Physical Edges
